Education

Minerva University — **San Francisco, CA**

B.Sc. in **Computer Science and Artificial Intelligence** | GPA: 3.70 — Expected May 2027

- Relevant coursework: Software Engineering, Data Structures, Algorithms, Machine Learning, Statistics, Economics

Skills

- **Languages & Frameworks:** Python, Rust, SQL, TypeScript, Next.js, React.js, Node.js, FastAPI, Flask, SQLAlchemy, Tauri, PyTorch
- **Databases & Cloud:** PostgreSQL, AWS (EC2, Nitro Enclaves, KMS), Docker, Kubernetes, Kafka, Linux, Git, GitHub Actions

Experience

Global Launchers Inc. (Business Growth & Digital Transformation Advisory) — **Nagoya, Japan**

CTO & Tech Lead — May 2025 – Present

- Launched a live India business news platform for Japanese executives, reaching 200 monthly readers in 3 months, by designing, building, and deploying the full stack alone (Next.js, Supabase/PostgreSQL, Anthropic API).
- Eliminated 10 hrs/week of manual curation with 95% daily publish success by building an ingestion pipeline that deduplicates and clusters 500+ articles/day from 45+ RSS feeds and checks each AI-written article against its sources before publishing.

Piece.ai Inc. (Enterprise AI Agent Platform) — **Tokyo, Japan**

Software Engineer Intern, AI Agents & Backend — Nov 2026 – Present

- Cut design-review turnaround from 2 days to same day by adding per-branch Vercel preview deploys for the Next.js frontend to a monorepo with 8 CI/CD workflows (Rust/axum, PostgreSQL, GCP Cloud Run).
- Restored CI for the whole organization after an outage that stopped every workflow, with 0 recurrences, by tracing it to 16 hung deploy runs that had used up the GitHub Actions quota and moving builds to Vercel's Git integration.

EAGLYS Inc. (AI & Data Security Company) — **Tokyo, Japan**

Software Engineer Intern, AI Infrastructure — Jul 2024 – Apr 2026

- Kept 100% of prompts unreadable to the host, even with root access, across 1K+ test requests at <8% latency overhead by running GPT-2 inference inside AWS Nitro Enclaves (Python, React) with RSA-encrypted transport over vsock (open-source rebuild).
- Cut environment setup by 92% (60 → 5 min) and enabled 3 client pilots by building a Flask/boto3 control plane that provisions EC2 instances, enclaves, and KMS keys in one step; documented it and presented it to 40+ industry professionals.

GSP Cloud (AI Agent Platform) — **Seoul, South Korea**

Software Engineer Intern, Full-Stack — Jan 2025 – Apr 2025

- Raised onboarding satisfaction by 30% in a 20-user pilot and cut support tickets by 35% by building a TypeScript/React console on Supabase (PostgreSQL) with REST APIs managing 50+ AI agent workflows and secure file transfers.

BearVFX (AI & Virtual Human Technology Company) — **Taipei, Taiwan**

Software Engineer Intern, AI Applications — Sep 2024 – Dec 2024

- Cut lecture production from 4 hrs to 8 min per video at 0.92 SyncNet sync confidence across 25 test videos by building a Python pipeline (GPT-3.5, SpeechT5, Wav2Lip, PyTorch, FFmpeg) that turns a topic into a narrated, lip-synced video.

Selected Projects

Kafka In Python (2026) | GitHub | Python, Docker Compose, HTTP/REST, Distributed Systems

- Recorded zero lost acknowledged writes across 409,976 writes and 22 fault-injection runs by implementing a Kafka-style replicated log with ISR, leader failover, and idempotent producers.
- Scaled write throughput 2.2x (254 → 569 records/s, 31 ms p99) by partitioning topics; failed over to a new leader in 1.6 s.

Veradact (2026) | Live Product · GitHub | TypeScript, Next.js, PostgreSQL, Drizzle ORM, MCP, Anthropic API

- Piloted with 12 beta users across 4 software agencies, who confirmed 110+ requirements (68% within 5 business days), by storing every sign-off as an append-only, hash-chained event log in PostgreSQL with point-in-time replay of any past state.
- Prevented cross-tenant data leaks in 700+ tests using PostgreSQL row-level security and triggers.
- Caught 8 AI-generated code defects before merge by reviewing Claude Code diffs against 67 design decisions.

idobataAI (2026) | Live Product · GitHub | Next.js, TypeScript, PostgreSQL, Supabase, OpenAI API

- Supported 400 AI engagement jobs/day with a PostgreSQL queue using atomic claims, expiring leases, retries, and idempotent writes.
- Reduced escaped regressions by 40% by implementing CI/CD gates with unit, integration, and SQL contract tests validating database access controls, AI-provider fallbacks, and job recovery.
